Path and Circuits

Definition (in undirected graph)

- Path (đường đi) of length n from u to v: a sequence of n edges $\{x_0, x_1\}, \{x_1, x_2\}, \ldots, \{x_{n-1}, x_n\}$, where $x_0 = u$ and $x_n = v$.
- A path is a circuit (chu trình) if it begins and ends at the same vertex, u = v.
- A path or circuit is simple (don) if it does not contain the same edge more than once.

Connectedness in Undirected Graphs

Definition

- An undirected graph is called connected (liên thông) if there
 is a path between every pair of distinct vertices of the graph.
- There is a simple path between every pair of distinct vertices of a connected undirected graph.

How Connected is a Graph?

- -A connected graph 'G' may have at most (n-2) cut vertices
- -a cut edge e G if and only if the edge 'e' is not a part of any cycle in G
- -the maximum number of cut edges possible is 'n-1' (n is num of vertices)

Definition

- b is a cut vertex (đỉnh cắt) or articulation point (điểm khóp).
 What else?
- $\{a,b\}$ is a cut edge (cạnh cắt) or bridge (cầu). What else?

Bellman-Ford Algorithm Floyd-Warshall Algorithm Ford's algorithm

Graph Coloring

Definition

- This graph doesn't have cut vertices: nonseparable graph (đồ thị không thể phân tách)
- The vertex cut is $\{c,f\}$, so the minimum number of vertices in a vertex cut, vertex connectivity (liên thông đỉnh) $\kappa(G)=2$.
- The edge cut is $\{\{b,c\},\{a,f\},\{f,g\}\}$, the minimum number of edges in an edge cut, edge connectivity (liên thông cạnh) $\lambda(G)=3$.

Applications of Vertex and Edge Connectivity

- Reliability of networks
 - Minimum number of routers that disconnect the network
 - Minimum number of fiber optic links that can be down to disconnect the network
- Highway network
 - Minimum number of intersections that can be closed
 - Minimum number of roads that can be closed

Connectedness in Directed Graphs

Definition

- An directed graph is strongly connected (liên thông mạnh) if there is a path between any two vertices in the graph (for both directions).
- An directed graph is weakly connected (liên thông yếu) if there is a path between any two vertices in the underlying undirected graph.

Graph Coloring

Solution

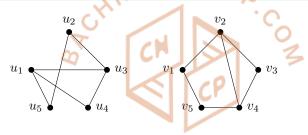

BACHKHOACNCP.COM

H has a simple circuit of length three, not G.

Applications

Example

Determine whether the graphs below are isomorphic.

Solution

Both graphs have the same vertices, edges, degrees, circuits. They may be isomorphic.

To find a possible isomorphism, we can follow paths that go through all vertices so that the corresponding vertices in the two graphs have the same degrees BACHKHOACNCP.COM

Floyd-Warshall Algorithm

What is Euler Path and Circuit?

KHOACNCY

 Euler Path (đường đi Euler) is a path in the graph that passes each edge only once.

The problem of Seven Bridges of Königsberg can be also stated: Does Euler Path exist in the graph?

 Euler Circuit (chu trình Euler) is a path in the graph that passes each edge only once and return back to its original position.

From Definition, Euler Circuit is a subset of Euler Path.

It must be a connected graph before being a Euler path/circuit

Problem

KHOACNC

The problem is also sometimes called the single-pair shortest path problem, to distinguish it from the following generalizations:

- The single-source shortest path problem, in which we have to find shortest paths from a source vertex v to all other vertices in the graph.
- The single-destination shortest path problem, in which we have to find shortest paths from all vertices in the graph to a single destination vertex v. This can be reduced to the single-source shortest path problem by reversing the edges in the graph.
- The all-pairs shortest path problem, in which we have to find shortest paths between every pair of vertices v, v' in the graph.

These generalizations have significantly more efficient algorithms than the simplistic approach of running a single-pair shortest path algorithm on all relevant pairs of vertices.

Bellman-Ford Algorithm

```
procedure BellmanFord(G,a)
// Initialization Step
 forall vertices v
    Label[v] := \infty
    Prev[v] := -1
 Label(a) := 0 // a is the source node
// Iteration Step
  for i from 1 to size(vertices)-1
   forall vertices v
     if (Label[u] + Wt(u,v)) < Label[v]
       then
         Label[v] := Label[u] + Wt(u,v)
         Prev[v] := u
// Check circuit of negative weight
    forall vertices v
      if (Label[u] + Wt(u,v)) < Label(v)</pre>
        error "Contains circuit of negative weight
```

Property

any G, any weighted; one-to-all; detect whether there exists a circle of negative weight; complexity $O(|V| \times |E|)$.

Application

Problem

A young professor in Hue is invited to teach some years in Ho Chi Minh university of technology. He decides to represent the diverse operations of his transfer by a graph and, in this purpose, establishes the list of following operations:

- A: Find a house in Ho Chi Minh city.
- B: Choose a removal man and sign a contract of move
- C: Make pack his furniture by the removal man
- D: Make transport his furniture towards Ho Chi Minh city
- E: Find an accommodation to HCM (from Hue)
- F: Transport his family to HCM
- G: Move into his new accommodation
- H: Register the children to their new school
- I: Look for a temporary work for his wife
- J: Fit out the new accommodation and pay this arrangement with the first treatment of his wife
- K: Find a small bar to celebrate in family the success of the move and express the enjoyment to live in a good accommodation arrangement

KHOACN

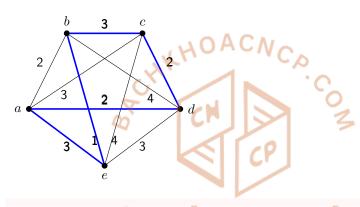

Problem

- Given a set of n customers located in n cities and distances for each pair
 of cities, the problem involves finding a round-trip with the minimum
 traveling cost.
- The vehicle must visit each customer exactly once and return to its point of origin also called depot.
- The objective function is the total cost of the tour.
- NT-complete: all known techniques for obtaining an exact solution require an exponentially increasing number of steps (computing resources) as the problems become larger.
- TSP is one of the most intensely studied problems in computational mathematics, yet no effective solution method.

BổI HCMUT-CNCP

BACHKHOACNCP.COM

Traveling Salesman Problem

- The total number of possible Hamilton circuit is (n-1)!/2.
- For example, if there are 25 customers to visit, the total number of solutions is $24!/2 = 3.1 \times 10^{23}$.
- If the depot is located at node 1, then the optimal tour is 1-5-2-3-4-1 with total cost equal to 11.

Problem

- The vehicle routing problem involves finding a set of trips, one for each vehicle, to deliver known quantities of goods to a set of customers.
- The objective is to minimize the travel costs of all trips combined
- There may be upper bounds on the total load of each vehicle and the total duration of its trip.
- The most basic Vehicle Routing Problem (VRP) is the single-depot capacitate VRP.

Graph coloring

Definition

- A coloring (tô màu) of a simple graph is the assignment of a color to each vertex of the graph so that no two adjacent vertices are assigned the same color.
- The chromatic number ($s\acute{o}$ màu) of a graph, denoted by $\chi(G)$, is the least number of colors needed for a coloring of this graph.

Four color theorem

Theorem (Four color theorem)

The chromatic number of a planar graph is no greater than four.

- Was a conjecture in the 1850s
- Was not proved completely until 1976 by Kenneth Appel and Wolfgang Haken, using computer
- No proof not relying on a computer has yet been found
